

# ShiftMind: Shared Workforce Memory and Agentic Analysis on Smart Glasses

Jose Manuel Davila Mancilla<sup>†</sup> · Eduardus Tjitrahardja<sup>†</sup> · Yuntao Wang

Tsinghua University · <sup>†</sup> equal contribution

A returning customer walks in, and their memory card is already on the worker's display.

**Recognition is the query.**

The proactive loop: first visits auto-enroll, recognized customers surface their card with no query, memory is shared across workers, and questions are asked by voice.

## 1 Proactive

A 3-of-5 face vote confirms the customer and the card appears unprompted. First-time visitors are enrolled on the spot, ready for the next visit.

## 2 Shared & cumulative

Cards span employees and sites, so a different worker inherits the relationship. One curated card per customer, rewritten each visit, not appended transcripts.

## 3 Agent-queryable

A tool-using agent answers recall and insight questions over the whole workforce log, by voice from the glasses or from the laptop dashboard.

### UNDER THE HOOD

Rokid AI glasses handle camera, microphone, and HUD only; a laptop FastAPI server does the rest: InsightFace ArcFace 512-D recognition with Milvus, Doubao streaming ASR, LLM memory cards, and the Q&A agent. Plain HTTP and WebSocket, no paired phone, code and integration notes released.
